

Monkeypox or W.H.O.'s Monkey Business?

Ginning Up the Next Pandemic

May 27, 2022

The **CDC issued an advisory last week** asking doctors to be on the **lookout for monkeypox** after confirming its presence in 7 states. The World Health Organization (WHO) is said to be investigating 237 cases in 19 countries outside of Africa, where the virus is endemic.

The **WHO regional director** for Europe **has warned that cases of monkeypox could accelerate in the coming months**, as the virus spread across Europe.

[The director cautioned](#), "as we enter the summer season ... with mass gatherings, festivals and parties, **I am concerned that transmission could accelerate.**"

Not to be outdone, the **White House** senior director for global health security, Dr. Raj Panjabi, **hyperventilated**, "**A monkeypox outbreak of this scale and scope across the world, it has not been seen before.**"

Monkeypox Cases Are Exploding, We Should Be Worried Says Dr. Eric Feigl-Ding

DR. ERIC FEIGL-DING

**MONKEYPOX IS
EXPLODING!!!**

**And, Most Of Us Have No
Immunity**

EXCLUSIVE 5/28/2022 12:59 PM PT

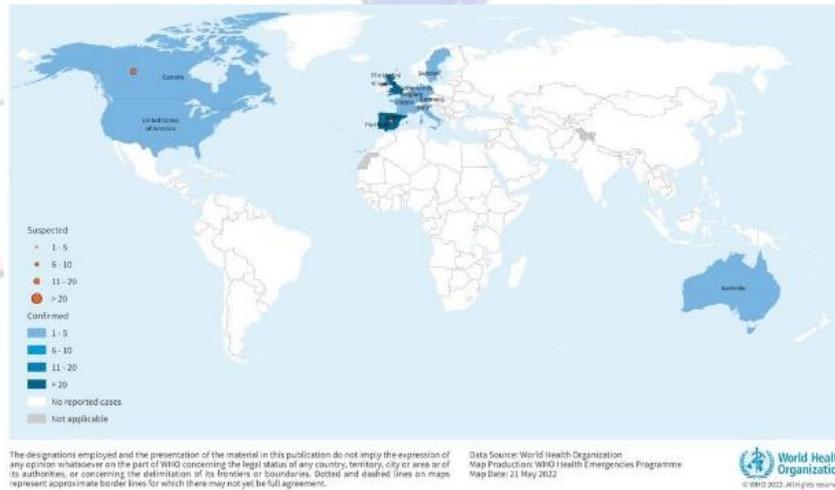

The **mainstream media quickly followed suit**, breathlessly **hyping the spread of monkeypox** in Europe and North America (see graphic). The press has **mostly ignored how extremely rare the condition remains and the difficulty of disease transmission.**

REAL HEALTH *FLASH*: Medicine that's **Right***

The media have also **failed to clarify who is at highest risk**. According to WHO and CDC, **nearly all cases identified outside of Africa occur in homosexual and bisexual men who contract the disease through sexual contact. Only 2 cases are recorded among women** as of this writing (see graphic).

Monkeypox Outbreak: Gender distribution

confirmed cases (worldwide)

Female: 2, Male: 111, not specified: 107 -- 5/25/2022

WHO officials said [the leading theory to explain](#) the spread of the disease was **sexual transmission among gay and bisexual men** at two raves held in Spain and Belgium. The source at those events has not yet been identified.

Most people have never heard of monkeypox

Our impression is that most Americans have no clue what the monkeypox is and who is most susceptible. Still battered and sensitized by COVID hysteria, an **uninformed public remains vulnerable to media, White House and WHO hype about the potential for the next pandemic.**

Monkeypox is a **rare disease caused by viral infection related to smallpox.** It was first discovered in 1958 when a pox-like disease broke out in some monkeys kept for research.

The first human case of monkeypox was recorded in 1970 in the Congo, although has likely been endemic in the region for millennia, and since then has largely been restricted to the African continent. African rodents and monkeys are thought to harbor the virus, which is transmitted to humans through close contact such as butchering and consumption of infected animals.

The disease is characterized by initial onset of fever, headache, swollen lymph glands and fatigue, followed by a rash that progresses into fluid filled vesicles and pustules which are highly contagious.

According to the CDC, as many as 10% of those infected may die from the disease depending on the strain. Fortunately **the strain circulating in the western world is much milder and unlikely to cause fatalities**, but that 10% figure is likely to generate (intended?) alarm.

Most people recover from the disease within a few weeks. **Vaccines against smallpox, a related disease, are also effective in preventing monkeypox**, and some antiviral drugs are being developed. CDC indicates that **prior vaccination against smallpox is 85% effective.**

However, **smallpox vaccines have a high incidence of side effects**, including **myocarditis and pericarditis** (sound familiar?). ***It makes no sense in our opinion to be vaccinated against this extremely rare disease unless you fall into a high-risk group with known intimate exposure to an infected individual.***

Now this is where the story gets really strange.

Some of you may recall that **prior to the outbreak of SARS-CoV-2**, an international group convened at Johns Hopkins to conduct a tabletop (a kind of round table discussion) **simulation of a global pandemic. Known as Event 201**, the exercise was **intended to create sufficient alarm among participants that they would help drive a set of global agreements** around testing, vaccine development, and pandemic response.

- The **date of the simulation was October 18, 2019, just before SARS-CoV-2 was unleashed on the world from a lab in Wuhan.**
- **The virus in the simulation would be a corona virus** highly transmissible from person to person (sounds a lot like COVID-19).
- The **event sponsors** included the World Economic Forum and the **Bill and Melinda Gates Foundation.**
- Many recommendations for **Global control of pandemics** from the Hopkins exercise have been incorporated in proposals before the WHO this week.

If you thought Event 201 was just a coincidence, wait until you see the Munich pandemic simulation.

In March of 2021 in Munich, a number of political leaders and global health experts **conducted another tabletop simulation involving a deadly monkeypox outbreak** (we kid you not).

The [exercise scenario](#) portrayed "*a deadly, global pandemic involving an unusual strain of monkeypox virus that emerged in the fictional nation of Brinia and spread globally over 18 months.*" The virus was engineered in a laboratory with "*inadequate biosafety and biosecurity provisions and weak oversight.*"

Here is the kicker: **The "simulated" outbreak would occur on May 15, 2022, the same date there just happened to be an actual outbreak of monkeypox in the western world.**

Two coincidences? How about a third?

[As reported](#) in the National Pulse, in February 2022, the journal Virologica Sinica published a **recent gain of function research** project performed by scientists at **the Wuhan Institute of Virology (of course) in August 2021 while the COVID-19 pandemic was still raging around the world.**

The Wuhan scientists assembled a monkeypox virus genome using a method researchers flagged for potentially creating a “contagious pathogen.” The study **preceded the actual outbreak of monkeypox by just 3 months.**

According to the National Pulse, the study follows the Wuhan Institute of Virology conducting similar research into strains of bat coronaviruses that could infect humans while admitting its facilities lacked proper laboratory safety protocols.

While Singapore and Australia have recorded several monkeypox cases, **none have been reported in China.**

The fourth coincidence may indicate where all this is heading

As seen with COVID-19 and the nearly instantaneous availability of vaccines, **Big Pharma somehow anticipated a monkeypox pandemic way back in 2019.** In this instance, a biotech company Bavarian Nordic gained **FDA approval in 2019 for [JYNNEOS](#), a smallpox and monkeypox vaccine**, despite the complete global absence of the former and extreme rarity of the latter.

Then, no sooner had WHO announced the presence of a monkeypox breakout in the western world, the UK Health Security Agency published this month a detailed [document](#) titled, **“Recommendations for the use of pre and post exposure vaccination during a monkeypox incident.”**

Remarkable. Like COVID-19, it’s starting to feel like all roads lead to vaccines again.

Will this year see more outbreaks leading to health mandates and restriction of personal freedom?

As with COVID-19, it appears that **remarkably prescient global health planners and biotech companies have been eagerly awaiting a market such a "pandemic" would present.**

With the World Health Organization meeting in Geneva this week to work on global control of health and pandemics, and the White House cranking up the fear factor once again, **we may well be headed toward more mandates and less freedom this year.** With public attention in COVID waning, **more crises will be essential to regain control of the populace.**

Already, efforts are underway to develop international standards for vaccine passports and digital IDs that would include personal health data.

Lest you think we overstate the intention of the **WHO to develop such an ID and global data collection mechanism**, see this summary of WHO stated goals.

- *Tie a digital passport and digital identification system to its international pandemic treaty.*
- *Finalize the treaty by 2024 and aims to ask member countries to move governing authority to the WHO in the event of a pandemic.*
- *Subvert national sovereignty with a legally binding agreement in the form of the WHO's revised International Health Regulations which are currently being negotiated in Geneva.*

Remember, the issue is never the issue.

As we have discussed previously, we believe **the end goal** of all this medical fearporn and hysteria is to **force everyone carry a digital ID card tied to a massive database. Global pandemics are just the vehicle to achieve this end.**

Vaccine passports are one short step away from the CCP's Social Credit Score system that accumulates vast amounts of data on every citizen, enabling complete control over their lives – access to jobs, services, travel, banking, housing, etc.

Resist this agenda with all your might. Let your representatives know that conceding US sovereignty to the WHO is a non-starter regardless of the latest fearporn-driven epidemic.

FLASHBITS:

I bet the "k" in
"monkeypox" is silent...
